Users by State

The visual shown below is a bar graph of the number of users by state. As seen, the top states three are Florida (FL), New York (NY), and Pennsylvania (PA). One unique thing to notice about the data is that some of the states that have smaller population have more users than some of the states with bigger populations. These examples include Florida having more users than New York and California (not combined) or Pennsylvania having more than Texas and California (not combined). Because of this, there should be more investigation into why some of these smaller states have more users than the bigger states.

```
ggplot(data = users, mapping = aes(x = STATE)) +  
  geom_bar()
```
